Modern Global Dominance

 $\begin{array}{c} {\rm Mini\text{-}Project} \\ {\rm Multidimensional~Data~Analysis} \\ {\rm DMKM} \end{array}$

Carlos López Roa me@mr3m.me

February 5, 2016

Abstract

As a foreign student in the DMKM master, the author has posed several times the question: What makes the wealth of a country?, Of course there exists several types of wealth, namely: Demographic, Economic, Natural, Cultural, Energetic, or even Military; Still a clear answer to the above question is to be searched and, if possible, found in this study. For this purpose a dataset of several indicators of the countries integrating the United Nations was retrieved, preprocessed and studied using the factorial methods of PCA¹, CA² and FDA³. At the end some conclusions are drawn about the nature of dominance of the countries.

1 Data preparation

Information about 90 selected indicators⁴ of the 193 countries (figure 1-1) integrating the United Nations was retrieved from the Wolfram|Alpha Knowledgebase [1] using a licensed copy of the Wolfram Mathematica software version 10.0. A full overview of the variables used is available in the appendix A.1. A dictionary of the countries name and code can be found in appendix A.2

Figure 1-1: Map showing the member states of the United Nations.

1.1 Dataset Preprocessing

As noted by [2] PCA might have troubles with variables which include big outliers, because in the normalization process, the mean of the sample resides far from both the majority of observations and the outliers. To bolster this issue, several strategies have been proposed, in particular, to make new synthetic variables taking the log of the original variables reducing the skewness. This was made for all nonnegative variables spanning several orders of magnitude which were heavily left skewed, as shown in figure 1-2. This can also help to densify the center of mass of the observations. The previous claim was proved experimentally as shown in the figure A-5.

Code for the querying and preprocessing transformations can be found in the appendix A.3.

¹Principal Component Analysis

 $^{^2}$ Correspondance Analysis

³Factorial Discriminant Analysis

 $^{^{4}}$ Demographic, Economic, Energetic, Communication, Geography

Figure 1-2: Histogram of the heavily skewed variables that span several orders of magnitude where treated taking the \log_{10} to reduce the skewness as a measure of robustness. As seen in the figure, the new synthetic variable has a distribution closer to the Normal. The skewness goes from 6.73 to 0.31 respectively

2 Data processing

The resultant file s1.xls was imported to a licensed copy of COHERIS SPAD version 8.2.18. The general schema of the process diagram is showed on figure 2-3.

First some descriptive statistics, and several normed PCA analysis on the different groups of variables was made as exploratory analysis. Then a normed PCA of the selected continuous variables was carried out to reduce the dimensionality of the dataset. Also a CA was made for two categorical variables to explore the relation between the continent and the economic sector, and finally a FDA was made to predict the economic sector based on the continuous variables.

2.1 Exploratory PCA

Since the data is composed of 84 continuous variables, a more extensive approach was taken with the PCA method. Namely, exploring each group of variables separately as exploratory analysis to give some insight in the nature of the variables of each group. The categorical variable Continent has frequencies as showed in figure 2-4.

Figure 2-3: General process diagram of the analysis. In the first stage six different PCA were carried out as exploratory analysis. Then a PCA analysis was done in a subset of the continuous variables, a CA was made after binding modalities on two variables and a FDA on factors to explain a categorical variable.

Figure 2-4: The total of 193 countries being studied are distributed amongst their respective continents as showed in the chart.

2.1.1 Demographics

A normed PCA of the Demographic group of variables was carried out leading to the results shown in figure A-6. Around 73% of the total inertia can be explained in the first two factors. There exists a high correlation between variables such as: Poverty Fraction, Birth Rate Fraction, Total Fertitility Rate, Population Growth and Infant Mortality Fraction. Group which is in contraposition with the highly correlated variables:

Literacy Fraction, Life Expectancy and Median Age. A group of correlated variables stays in perpendicular relation with these contraposition and is composed of the variables Annual Births, Child Population, Population, Annual Deaths, Adult Population and Elderly Population.

When we plot the observations in this factors we can see that countries such as NG: Federal Republic of Nigeria, NE: REPUBLIC OF NIGER, TD: REPUBLIC OF CHAD lead the first quad- rant^5 , that is the one associated with high Poverty Fraction, high Birth Rate Fraction, etc. In the second quadrant countries such as NR: REPUB-LIC OF NAURU, TV: TUVALU and PW: REPUB-LIC OF PALAU all three in OCEANIA lead, that is they can be characterized by low Annual Births and Population. In the third quadrant we find countries such as AT: Republic of Austria, DE: Federal REPUBLIC OF GERMANY and GB: UNITED KING-DOM OF GREAT BRITAIN AND NORTHERN IRELAND that are characterized by high Literacy Fraction, high Life Expectancy, low Poverty Fraction and Population Growth. In the fourth quadrant we find countries such as IN: REPUBLIC OF INDIA, CN: PEOPLE'S REPUBLIC OF CHINA and ID: REPUB-LIC OF INDONESIA which are characterized by high Population, high Elderly Population, Annual Births and Annual Deaths.

The continent has been plotted as a supplementary variable, showing that AFRICA is located in the first quadrant, OCEANIA and NORTH AMERICA in the second, EUROPE and SOUTH AMERICA in the third and ASIA in the fourth. A thing to note is the position of the member of the G8⁶, as a representative of the world dominance, we observe that they are grouped around the second factor negative direction, that is, demographically speaking, countries with high Population, high Life Expectancy and Literacy Fraction but still low Poverty Fraction, Total Fertitility Rate and Population Growth.

2.1.2 Economics

A normed PCA of the Economic group of variables was carried out leading to the results shown in the figure A-7. Around 58% of the total inertia can be explained in the first two factors. exists a high correlation between the variables: GDP. GDP At Parity, Government Receipts, Government Expenditures, Government Debt, Foreign Exchange Reserves, External Debt, this correlation is also very high with the first factor in the positive direction. Also the variables GDP Industrial Production Growth Real Growth, and Exchange Rate are highly correlated between each other and also to the second factor in the positive direction. The variableLabor Force is in the first quadrant, as a combination of the first and second factor in the positive direction, also the variable GDP Per Capita is in the fourth quadrant as a combination but in the negative direction of the second factor, and the variable Unemployment Fraction is in contrapositive with Unemployment Fraction.

When we plot the observations in the factor plane we can see that, in the first factor, the countries with highest values are: US: UNITED STATES OF AMER-ICA, JP: JAPAN, DE: FEDERAL REPUBLIC OF GER-MANY, FR: FRENCH REPUBLIC, that is, countries with high GDP, External Debt and both Government Receipts, Government Expenditures, Government Debt, Government Expenditures. Contrary to this, countries with the most negative value in the first factor NR: Republic of Nauru , KI: Republic of KIRIBATI, and TO: KINGDOM OF TONGA in OCEA-NIA. In the second factor, the countries with the most positive value are: ET: FEDERAL DEMOCRATIC RE-PUBLIC OF ETHIOPIA, AO: REPUBLIC OF ANGOLA, TZ: UNITED REPUBLIC OF TANZANIA in AFRICA. And in the opposite direction we have LU: GRAND DUCHY OF LUXEMBOURG, EE: REPUBLIC OF ES-TONIA, IS: ICELAND.

The Continent and the Sector Labor Fractions has been plotted as supplementary variables, showing that Europe has the highest value in the first factor, still keeping negative value in the second, whereas ASIA and SOUTH AMERICA have both high value in both factors, Africa is in the second quarter and NORTH AMERICA and OCEANIA have both negative values in the first and second factor. The Sector Labor Fractions SERVICES is in the fourth quadrant, close to Industry, Agriculture is in the second quarter, and INDUSTRY AND SERVICES is in the third quarter. A thing to note is the locus of the countries members of G8, seven out of 8 remain really close, apart from anyone else, in the fourth quadrant, that is with high External Debt, GDP, and the highest GDP Per Capite but low Exchange Rate, GDP Real Growth, Industrial Production Growth and low Unemployment Fraction.

2.1.3 Energy

A normed PCA of the Energy group of variables was carried out leading to the results shown in the figure A-8.

Around 56% of the total inertia can be explained in the first two factors. There exists a high correlation between the variables: Oil Imports, Oil Consumption, Electricity Production, Electricity Consumption, and Electricity Imports in the first quadrant. Also the variables Natural Gas Reserves, Oir Reserves, Natural

 $^{^{5}}$ in the geometric sense

 $^{^6 \}rm Group$ of the eight most industrialized countries: FR, DE, JP, GB, US, CA, IT and RU

Gas Production and Oil Production are highly correlated between each other in the fourth quadrant. The variables Oil Exports and Natural Gas Consumption are also situated in the fourth quadrant.

When we plot the observations in this factorial plane we can see that US: UNITED STATES OF AMERICA is far from any other observation with the highest value in the first facthat is a combination of Oil Imports, Oil Consumption, Electricity Production, Electricity Consumption, Electricity Imports, Natural Gas Reserves, Oil Reserves, Natural ${\tt Gas}$ Production and ${\tt Oil}$ Production . Countries in the first quadrant, that is associated with Oil Consumption, Electricity Imports, Electricity Consumption and Electricity Production: ES: KINGDOM OF SPAIN, FR: FRENCH REPUBLIC, IT: ITALIAN REPUBLIC, JP: JAPAN. In the other hand, countries situated in the fourth quadrant, that is associated with Natural Gas Reserves, Oir Reserves, Natural Gas Production and Oil Production: RU: RUSSIAN FEDERATION, IR: ISLAMIC REPUBLIC OF IRAN and CA: CANADA. Countries close to the First factor, that is in a positive combination of the previous two groups are as previously mentioned, US, GB and IN. We must not forget that with synthetic logarithmic variables, now every distance in the play represents orders of magnitude, thus, the outlier US has significantly more energy consumption, production and trading that any other country. On the contrary, the country closer to the first factor axis but with negative coordinates is SL: Republic of Sierra Leone that is, with the less energy consumption, production and trading.

If we pay attention to the members of the G8 we see US, CA, RU in the fourth quadrant, that is of Oil producers, and the remaining GB, DE, JP, IT, FR of Oil importers and Electricity Producers. But still both are in the positive to far positive side of the First factor.

2.1.4 Communication

A normed PCA of the Communication group of variables was carried out leading to the results shown in the figure A-9.

Around 65% of the total inertia can be explained in the first two factors. There exists a high correlation between the variables: Airports, Television Stations, Internet Users, AM/FM Radio Stations, and Road Length with each other and with the first factor. Also the variables Merchant Ships, Merchant Ships Dead Weight and Merchant Ships Gross are highly correlated between each other in the fourth quadrant.

When we plot the observations in this factorial

plane we can see that US: UNITED STATES OF AMERICA is far from any other observation with the highest value in the first factor, followed by BR: FEDERATIVE REPUBLIC OF BRAZIL, RU, CN, MX, that is with high volume of land and radio communications. Countries with high values in the sector factor: PA: REPUBLIC OF PANAMA, LR: REPUBLIC OF LIBERIA that is with high values in Merchant Ships.

If we pay attention to the members of the G8 we see US in the far positive factor, that is with high values in communication infrastructure, the remaining members remain close to each other with high values in the first factor.

2.1.5 Geography

A normed PCA of the Geography group of variables was carried out leading to the results shown in the figure A-10.

Around 57% of the total inertia can be explained in the first two factors. There exists a high correlation between the variables: Area, Water Area, Boundary Length, Coastline Length, and Arable Land Area with each other and with the first factor. Also the variables Irrigated Land Fraction and Arable Land Fraction are highly correlated between each other in the negative direction of the second factor. There exist opposition by the variable Lowest Elevation in this second factor. And the variables Crops Land Area and Irrigated Land Area are correlated and in the fourth quadrant.

When we plot the observations in this factorial plane we can see that US, CA, RU, CN, IN have the highest values in the first factor, that is related with the size of the country. In the negative direction of the second factor we find MD: REPUBLIC OF MOLDOVA with high values in the Arable Land Fraction and Irrigated Land Fraction. On the other hand, countries with low values in the first factor are MC PRINCIPALITY OF MONACO, VC SAINT VINCENT AND THE GRENADINES, BB: BARBADOS that is, small countries.

If we pay attention to the members of the G8 we see US, CA, RU in the far positive factor, that is with high values in size the remaining members remain close to each other with not that high values in the first factor.

2.1.6 Military

A normed PCA of the Military group of variables was carried out leading to the results shown in the figure A-11.

Around 79% of the total inertia can be explained in the first two factors. There exists a high correlation between the variables: Military Fit Population, Military Age Rate and Military Age Males with each other and with the first factor. Also the variable Military Expenditure Fraction is highly correlated with the second factor. And the variable Military Expenditure is in the first quadrant.

When we plot the observations in this factorial plane we can see that CN, IN, US have the highest values in the first factor, that is related with the Military Fit Population of the country. In the negative direction of the second factor we find ST: DEMOCRATIC REPUBLIC OF SAO TOME AND PRINCIPE. On the other hand, countries with high values in the second factor are OM: SULTANATE OF OMAN and QA STATE OF QATAR, that is, with high values in Military Expenditure Fraction.

If we pay attention to the members of the G8 we see US, CA, RU in the far positive factor, that is with high values in Military Fit Population the remaining members remain close to each other with not that high values in the first factor.

2.2 PCA

Having explored these groups a variables, a normed PCA was made selecting 16 active variables, namely: Life Expectancy, Population, Population Growth, Total Fertility Rate in the DEMOGRAPHICS; Foreign Exchange Reserves, GDP, GDP Per Capita, and Labor Force in the ECONOMICS; Electricity Production, and Oil Exports in the ENERGY; Airports, Internet Hosts and Road Length in the COMMUNICATION; Arable Land Area and Area in the GEOGRAPHY and Military Expenditures and Military Fit Population in the MILITARY. All the other variables are used as supplementary.

The results of the test are shown in appendix A.4.1 and figures are shown in the appendix A-12.

Around 54.11% of the inertia is captured by the first factor and 22.93% by the second, that is a total of 77.04% is captured by the first two factors. The first factor is mainly composed, in decreasing order by: GDP, Military Fit Population, Internet Users, Road Length, Electricity Production, LaborForce and Population all with positive correlation. And the second factor is mainly composed by Total Fertility Rate with positive correlation, and GDP per Capita and Life Expectancy with negative correlation. Thus there exist contraposition between these variables. The third factor is mainly composed by Oil Exports with negative correlation and the fourth factor by Airports also with negative correlation.

When we plot the active cases we can observe in red, the countries members of the G8⁷ of the most industrialized countries are far to the right, where the US leads, followed by RU the remaining ones are

close to each other in the fourth quadrant. Interestingly enough, the members of the G5⁸, in purple, of the emergent economies also are far to the right, close to each other, but closer to the first quadrant, that is with more value in the second factor. An interesting case is that recently RU has been banned from the G8 as a consequence of the Ukrainian crisis and it's the farthest member of the G8 in the second factor. The members of the G10⁹embers of the IMF council NL KINGDOM OF THE NETHERLANDS, SE KINGDOM OF SWEDEN, BE KINGDOM OF BELGIUM, CH SWISS CONFEDERATION which are not members of the G8 are shown also together, with less value in the first factor, but still more value in the negative direction of the second factor.

As extreme cases, we may note, the US with the most positive value in the first factor, in the other side ST Democratic Republic of Sao Tome and Principe with the most negative value. With the most positive value in the second factor NE Republic of Niger and CD Democratic Republic of the Congo and with the most negative value SG Republic of Singapore, LI Principality of Liechtenstein, MC Principality of Monaco, SM Republic of San Marino and AD Principality of Andorra.

2.3 CA

A Correspondence Analysis was carried out between two synthetic categorical variables, fabricated binding previous natural variables to assure nonzero frequencies in the contingency table. The modalities Industry, Industry And Services, Services from the variable Sector Labor Fractions where bound as Industry And Services and the modalities North America and South America where bound as America. A transcript of the printout can be found in A.4.2 and a figure of the result can be found in appendix A-13.

In the independence test a χ^2 of 75.01 with a expected χ^2_4 with four degrees of freedom with value 9.48773 thus we reject the null hypothesis of the independence and we conclude there exists relation between the two categorical variables.

The results show a relation between Continents EUROPE, AMERICA with Sector Labor Fractions INDUSTRY AND SERVICES, and also relation between AFRICA and AGRICULTURE in the only factor.

2.4 FDA

A Factorial Discriminant Analysis based on Factors was carried out to explain and predict the value of the categorical value Sector Labor Fractions. The

⁷US UNITED STATES OF AMERICA, RU RUSSIAN FEDERATION, CA CANADA, JP JAPAN, DE FEDERAL REPUBLIC OF GERMANY, FR FRENCH REPUBLIC, GB UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND, IT ITALIAN REPUBLIC

⁸CN People's Republic of China, IN Republic of India, BR Federative Republic of Brazil, MX United Mexican States, ZA Republic of South Africa

same variables used in the PCA where used as explanatory variables. The results can be seen in the printout A.4.3.

The first two factors explain 95% of the total inertia. The first factor is composed with negative correlation -1.00 by the variable Life Expectancy followed by Total Fertility Rate with positive correlation. The second factor is composed mostly by Military Fit Population and Labor Force with negative correlation.

The confusion matrix shows a 85% of well classified cases. The first factor has a high discriminant function and the model is significant with 0.000 risk. Also in terms of the original variables, the most discriminant variables is Life Expectancy

3 Interpretations

Trying to answer the firstly posed question What makes the wealth of a country? we may say: Taking the group of G8 as the ground truth for wealthy countries, that is, abundant of resources, with good quality of life, with international hegemony and influence, strong currencies, powerful armies, etc. We see all this elements effectively combined in the PCA study, saying: Wealthy countries have, high GDP, Electricity Production, Foreign Exchange Reserves, also they expend the most in Military and export Oil if any. They have high Life Expectancy and GDP per Capita, and this is may be the few variables related to people rather than macroeconomy, that is, in wealthy countries, people live more and they have more money, in wealthy countries, people are wealthy. This comes with a draw back of being in direct contraposition with the Total Fertility Rate, that is, in wealthy countries people have less kids.

Also something to note is that members of the G5 are similar to those of the G8 in macro variables such as GDP, Electricity Production, etc, but they also tend to have more population, area and arable land area, also more total fertility rate, still some less life expectancy and GDP per capita.

This draws important hypothesis. the amount of wealth is fixed, and is distributed amongst the citizens. Countries with high wealth but high population are perceived as poor because their lack of GDP per capita, and more wealthy countries have less population and less children per women, still more GDP per capita.

Also an interesting point to draw is the opportunity for other countries to enter the international hegemony based on their current wealth, this is the case of KR REPUBLIC OF KOREA, ES KINGDOM OF SPAIN, AU COMMONWEALTH OF AUSTRALIA, TR REPUBLIC OF TURKEY, PL REPUBLIC OF POLAND, SA KINGDOM OF SAUDI ARABIA, IR ISLAMIC REPUBLIC OF IRAN, AR ARGENTINE REPUBLIC, MY MALAYSIA, VE BOLIVARIAN REPUB-

LIC OF VENEZUELA and TH KINGDOM OF THAILAND which are close in the factor plane and thus have all the measured components of a wealthy country but still lack to have dominance in the international realm, may be just for lack of political will or strength.

The line that divides G8 from G5 seems to be the line of demography, one may say that a country is for it's children to come, so, one may say that the current G5 will be the tomorrow's G8 members based on the aging of the population.

Using CA we were able to describe the relation between the economic activity and the continent of the country. That is, countries of the European and American continent are related to the Industry and Services activity, whereas African countries are related to Agricultural activities.

Also using FDA we may say that the most discriminant variable to explain a countries activity is, by far, the Life Expectancy. And with this you can predict up to 85% of the observations.

MODEL 2 DEFINITION END

A.5 Figures

Figure A-5: Comparative results of the *naive* PCA using original and synthetic variables respectively. Naive PCA consists on a PCA with all continuous variables as active variables. In the PCA with the original variables, the distribution of the cloud of points is heavily left skewed, a few outliers can be seen to the right. In the PCA done with synthetic variables we see a more normal distribution of the cloud of points, thus densifying the center of mass still preserving roughly the order of previous observation points and the inertia of the factors.

Figure A-6: Results of the normed PCA carried out on the Demographic group of variables in the set.

Figure A-7: Results of the normed PCA carried out on the Economic group of variables in the set.

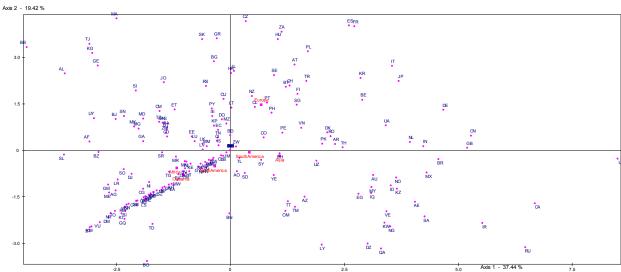

Figure A-8: Results of the normed PCA carried out on the Energy group of variables in the set.

Figure A-9: Results of the normed PCA carried out on the Communication group of variables in the set.

Figure A-10: Results of the normed PCA carried out on the Geography group of variables in the set.

Figure A-11: Results of the normed PCA carried out on the Military group of variables in the set.
